

me to Alberto

Feb 1

Good afternoon Dr. Rojas,

Dmitriy Voronin and I will be doing the final project together.

We will be naming it Space Database and it will be a database of space objects and their properties.

The entities of the database will be: planets, stars, galaxies, solar systems, man-made objects (satellites, rovers, etc.), and people who have discovered or made these entities. These entities' attributes will be: name, current coordinates, cost (if man made).

We will have relationships between the space objects and who discovered/made them as well as distance between space objects (ie. the distance between coordinates of one planet to another).

Can this plan change throughout the year? For example, if we want to add an entity or take away a relationship something from this initial, rough plan would that be OK?

Let us know of any critique or advice,  
Marjorie Yeaple-Betancourt
